**User Evaluation
Report**

For our User Evaluation we chose to have people play through our game whilst completing a set of given tasks which they are given beforehand, we chose these tasks to test the functionality of our program whilst also being a benchmark for useability and intuitiveness of our software.

Recruitment

We chose to test this way in an attempt to get unbiased feedback from a set of participants who were as close as possible to our target demographic, for this reason the people who tested our project were as close in age to us as possible, as the project is targeted at people slightly younger than us who are visiting the university on an open day. We felt that this was an accurate representation of our target demographic..

Data collection

All of our participants read through our [Information Sheet](#) for the test as well as our [Consent Form](#), they then signed copies once they had been read. We could then start with our tests. All forms signed by the users who took part in our testing as well as the feedback we got from their testing were kept in a secure Google Drive which only the team has access to, this was to make sure we followed all procedures correctly whilst respecting the privacy of our participants.

Tools and data

For user evaluation, we used Google Forms in order to gather data. This was done instead of written data collection or other forms of notes (physical or online) due to the ease of use and data display tools and categorisation provided by Google Forms. This assisted us with filling out Informed Consent Forms as well as the [Feedback Forms](#). After the participants had read through the Information Sheet for the test, they could fill out the Informed Consent Form to sign their consent in taking part in the testing session. Following the test, we could use the Feedback Form in order to gather and chart out data based on the results.

Procedures

Whilst the users were testing the program, we were to watch their attempts to complete the assigned tasks and take notes of the difficulty of completion as well as any usability problems or bugs encountered, we then also asked them on completion if they had any specific problems they encountered for the scenario where we may not of caught a problem, as all tracked with the Feedback Form.

The exact method consisted of observing our users test the system as opposed to testing it ourselves. This was done due to our contribution and time put into the project meaning that it would be hard to make sure that our feedback was honest and unbiased. This would be far from beneficial in a scenario where honest criticism is required so that we can work on improving our project.

User 3 - Ben

User 4 - Nana

User 5 - Tymur

User 6 - Gavindu

User 7 - Chris

Useability Problem	Severity
Move a building	
2. Lack of visual cue for closing the menu, difficulty when stopping placement.	4
4. The user tried to drag the building at first before finding the menu.	4
5. Tried to drag, bringing up the selection menu, figured it out from there.	3
Build roads between two buildings	
1. The user didn't realise that roads could be dragged and clicked on each grid section to place the roads.	5
6. Initially didn't realise they could drag roads and created 3 roundabouts.	3
Sell a building	
1. Slight difficulty - not knowing if unpausing was needed to click on a building.	2
4. The user got stuck placing a building, followed by using escape and deleting.	5
7. Didn't know that they could press esc to back out, stuck on placing a building.	5
Reach above 50 Satisfaction	
2. 0 Satisfaction. Difficulty understanding how satisfaction score is influenced and suggested a tutorial. Noted that they would understand on future runs.	6
3. Much more difficulty with this task - not clear how satisfaction increased, a lot of time spent figuring it out. A more complex task, took longer than the others.	6
4. Took a while to understand how satisfaction works, but managed to get 50 after a few minutes.	6
5. Scored 0. The user didn't understand the mechanics of increasing satisfaction, believing there was a bug.	10
6. Scored 20, not understanding how to increase satisfaction, but easily reached over 100 after explanation.	10
7. Particularly difficult, not understanding what influenced their score. Got a higher score after explaining.	8
Overall Feedback	
Overall, we found that users had a positive experience and were able to intuitively understand the basic mechanics of the game very quickly. However, we can see that the game had two main problems, a significant user experience issue with the satisfaction system, and a lesser issue relating to design. The first was the lack of information relating to the user influence on satisfaction score, as no tutorial meant that users had extra difficulty with the last task. The second was due to design incongruence when it came to attempts to drag or click (seen with unsuccessful attempts to drag buildings and the implication that roads couldn't be dragged). The extent of the first problem was evident with the user feedback, as many mentioned that a tutorial would be good. Another small issue was users being unaware of the functionality of the escape key.	N/A

In our results shown above we have removed some tests and results that didn't indicate any useability problems. For example we tested placing one of each building onto the map and pausing, but all users did this without issue so it felt obsolete to show in our findings.
